

Tele ophthalmology

We have a state of the heart ophthalmoscope.

Our tele ophthalmoscope service is also available as on demand services or home services.

It is designed for the 21st century.

It is a smartphone ophthalmoscope with a wide field of view and capable of retinal imaging with your own smartphone.

Our Ophthalmoscope can be used in your own optometry or general practice clinic, hospital, emergency department setting, and at home.

We use it for observation and recording of the cornea, lens, vitreous humour, and retina.

Pathological conditions of the eye can be directly observed, recorded, and shared through this ophthalmoscope. We record in either still or video mode.
